VULNERABILITY MANAGEMENT SERVICES

Proactive, Ongoing Detection and Remediation

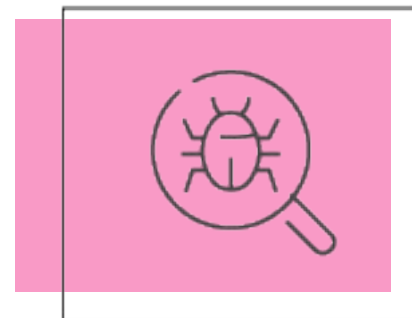

A vulnerability management service routinely scans for weak points in your system that could be exploited. The process happens instantly and provides real-time visibility into potential flaws so they can be prioritized and addressed before they pose a serious risk.

VULNERABILITY MANAGEMENT IN 4 STEPS

- 1 SCAN**
Routine scanning quickly identifies vulnerabilities in your network.
- 2 PRIORITIZE**
Vulnerabilities are prioritized based on type and potential impact on your business.
- 3 REMEDIATE**
The most critical vulnerabilities receive immediate attention and remediation.
- 4 REPORT**
Comprehensive vulnerability reports highlight areas of needed improvements.

DID YOU KNOW?

In 1999, MITRE Corporation began a list of new IT system flaws that could damage a computer system. It's called the Common Vulnerabilities and Exposures or CVE list, and they still publish it today. As new flaws are discovered, they are added to the list and assigned a criticality rating. A good technology provider keeps up on the latest CVEs and makes the necessary fixes to your tech environment.
